MedGate: Clinical Action Review Console

UnivaBio - Theme: Artificial Intelligence for Human Health | Shlok Vane (solo) | github.com/shlokgit-04 | shlok.is-a.dev/medgate

Purpose

AI agents in healthcare are beginning to act, not just answer: ordering labs, messaging patients, requesting refills, booking follow-ups. Every one of those actions deserves what a junior clinician would get: a quick human look before it goes out. Today, agent frameworks log what happened after the fact, but nothing gives a clinician a calm place to decide what should happen before it does. MedGate is that place: a review console where consequential agent actions wait in a queue with the evidence a human needs to decide in seconds.

Key features

- **Review queue:** pending agent actions (order lipid panel, 90-day refill, patient message, follow-up booking) with verdict pills (BLOCK / REVIEW / PASS) so risk is visible at a glance.
- **Case detail:** the reviewer's workspace. It shows the agent's stated plan beside the untrusted instruction the gate found inside a retrieved referral note, quoted verbatim and visually separated, with three explicit choices: Approve as requested, Trim & approve (execute only the original scope), or Block.
- **Audit log:** every gate decision, newest first, with timestamps and reasons.
- **Policy settings:** plain-language knobs: off-hours messaging hold, chart-mismatch holds ordering, controlled-substance ceiling, untrusted-text escalation, auto-clear routine reads.

Design decisions

- Untrusted content is always labeled and quoted, never paraphrased or summarized.
- Verdict pills pair color with a word, so color alone never carries meaning (accessibility).
- Every row, toggle and button is keyboard reachable with visible focus states.
- One decision per screen; the reviewer's next action is always the most prominent button.

What it is, honestly

A static front-end prototype: HTML, CSS and vanilla JavaScript, no backend. All patients, charts and messages are synthetic. No real PHI, no live EHR connection. This is a workflow mock-up, not a medical device, and it makes no diagnoses or treatment decisions.
